## Enermodal Healthcare Facilities: A cure for sick buildings

### The Enermodal Philosophy

Healthcare providers have a unique opportunity to combine their mission of improving the health of their patients with improving the well-being of healthcare facilities and environment. LEED buildings have been shown to increase occupant health and comfort, while decreasing operating costs and energy use.

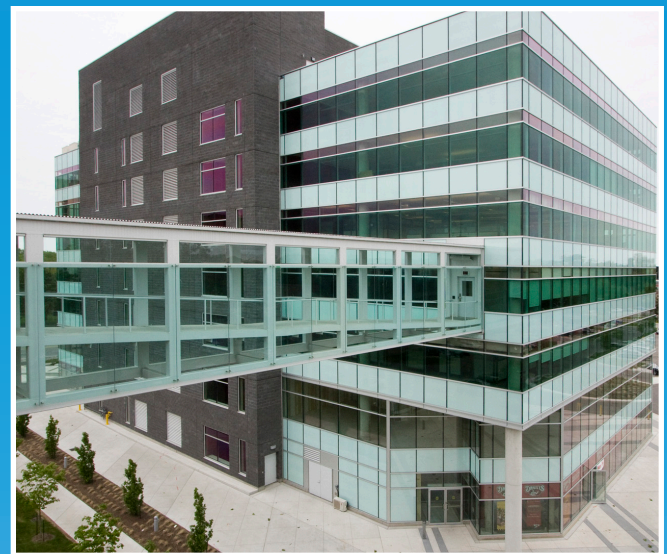

With its healthcare projects, Enermodal looks to implement green technology that has a natural fit with the needs of patients and healthcare providers. This includes improved ventilation for better air quality and infection control, fewer toxic chemicals in furniture and cleaning products, and greater daylighting and views for occupants.

### Featured Projects

**Upper River Valley Hospital** (Waterville, New Brunswick) – The first LEED certified, full-service hospital in Canada achieved LEED Silver through the use of low-emitting materials, energy-efficient lighting, and a rainwater cistern for toilet flushing.

**Grey Bruce Health Unit** (Owen Sound, Ontario) – This LEED Gold certified community health centre will save 1.8 million litres of potable water annually due to low-flow fixtures and a cistern.

**Trillium Health Centre Administrative Building** (Mississauga, Ontario) – This LEED Gold candidate includes improved air quality through demand-controlled ventilation.
